

TENDER · Product Overview

Get paid in the assets you'd rather hold.

\$TNDR · Solana (mainnet-beta) · Non-custodial · Receive-side RWA settlement rail
Infranodes · Confidential

0. One line

Every payment rail asks the sender what to send. TENDER asks the *receiver* what they want to hold. Set your election once — 60% SPYx, 30% USDC, 10% GLDx — and from then on, anyone who pays your handle pays you **in your portfolio**: tips, invoices, salary, splits. The sender sends whatever they have; you receive what you actually want. Payday becomes a buy order for your future.

1. Why now (deep-researched, Aug 2026)

- **Solana is the tokenized-stock capital of crypto (verified):** ~\$5.8B tokenized-equity DEX volume in Q2 2026, **95–97% of all cross-chain tokenized-stock volume for 54+ straight weeks**; xStocks' 60+ US stocks/ETFs (TSLAx, NVDAx, SPYx) live on Raydium/Jupiter, Ondo's 200+ more, 277k+ RWA-holder addresses. The assets people would *want* to be paid in already trade here, deep and 24/7.
- **Receive-side demand is proven institutionally:** the sector's first RWA payroll pilot (Plume × Toku × WisdomTree) let employees take salary in one tokenized money-market fund — powerful idea, closed rail: one company, one fund, a payroll provider, verified wallets.
- **Buy-side is solved, receive-side is empty:** MetaMask × Ondo lets users *swap into* 200+ tokenized assets. Nobody lets you *get paid into* them, permissionlessly.
- **The identity socket exists:** Solana has an **on-chain handle standard** — human-readable handles (NFT-registered, with a resolver exposing a primary destination, programmable payout splits, and a preferred-settlement-asset field). That preference field is a socket nobody has powered: the standard lets a handle *declare* what it wants to receive; TENDER is the engine that *delivers* it.

Category claim (permanent, verifiable): the first pay-by-handle rail that settles

in tokenized stocks.

2. How it works

1. **Claim your handle** (or link one you own from the handle registry). Set your election: any mix of eligible assets — tokenized stocks/ETFs (xStocks/Ondo), USDC, tokenized gold — bps summing to 100%.
2. **Get paid.** A sender pays your handle in whatever they hold (SOL, USDC, any listed SPL token). TENDER's settlement engine swaps at receipt via Jupiter — slippage-capped, price-sane, authenticity-gated — and delivers your elected assets to your wallet. Non-custodial, atomic: one transaction, no held balances.
3. **Split natively.** A handle can route to multiple recipients (the standard's payout splits) — and each recipient's *own* election applies to their share. One invoice pays three cofounders in three different portfolios.
4. **Invoice & links.** Create a pay-link/QR (amount, memo, expiry) that settles the same way — Solana Pay-compatible, so any wallet that scans a Pay QR can pay a TENDER invoice. Payroll lane: a funder vault pays a roster on schedule, each in their elected assets.

3. Beating the field

	Plume/Toku payroll pilot	MetaMask x Ondo	Hold-to-earn distributors	TENDER
Direction	Receive (closed pilot)	Buy-side swap	Passive fee drip	Receive, permissionless
Assets	One MMF	200+ (buy only)	Fixed/curated	Recipient-elected mix from the deepest RWA catalog on any chain
Identity	Verified wallets	Wallet address	Token holding	Human-readable handle
Who can use it	One company's employees	Swappers	Holders	Anyone paying anyone

Kill-shot line: *"Payroll pilots let one company's employees take salary in one fund. TENDER lets anyone on earth pay anyone in the assets they'd rather hold — with a name, not a base58 string."*

4. A Role For Everyone

Participant	Role	Reward
Receiver	Sets election on their handle	Every payment auto-DCAs their portfolio
Sender	Pays a name in any token	Zero friction; the rail handles conversion
Team/DAO	Payroll vault + splits	Salary-in-assets for the whole roster
\$TNDR staker	Secures params/registry	Fee share

5. \$TNDR token

SPL token, 80/10/5/5. Settlement fee (bounded bps) on converted volume + payroll-vault tiers → open-market \$TNDR buyback + staker pay. Fee-free path: same-asset payments settle free — growth first, monetize conversion.

6. Honest boundaries

- Elections only from the eligible registry (authentic + liquid); xStocks/Ondo tokenized stocks carry issuer geo-restrictions (not for US persons) — stated at election time; TENDER never custodies or issues, it routes.
- Conversion is best-execution within caps: a leg breaching slippage delivers in USDC with a notice, never a bad fill.
- Non-custodial: no held balances; the settlement either completes or safe-settles in the same transaction.
- Corporate actions: xStocks dividends accrue via the issuer's on-chain multiplier (Token-2022 Scaled UI) — delivered balances track it automatically; TENDER surfaces the multiplier, never fakes a cash dividend.
- TENDER settles payments; it is not payroll/tax software — employers integrate at their own compliance layer.

7. Roadmap

Phase	Ships
T1	Handle elections + pay-by-handle settlement (single recipient) + eligible-universe gate
T2	Splits with per-recipient elections + invoices/pay-links (Solana Pay QR)
T3	Payroll vaults (scheduled rosters) + \$TNDR genesis
T4	.sol-domain resolution adapter + social-binding pay + cross-chain pay-in routes

Kill/persist: T1 is the category claim and a complete product. If conversion volume < threshold by day 30, lead with the payroll-vault B2B lane (deposit-driven, not virality-driven) and keep the rail as infrastructure.
